

Dear Inviso Corporation Hiring Team,

I'm applying for the FDE Infrastructure SRE Engineer role supporting your enterprise AI platform. Consulting-style, client-facing infrastructure work is exactly the shape of engagement I've built my career around — entering unfamiliar systems, reverse-engineering how they actually work, and replacing fragile manual processes with automation that holds.

At Énergir, I standardized CI/CD delivery for 12 application teams across nine distinct runtimes, led cloud modernization onto Microsoft Azure with Terraform and Ansible IaC that eliminated configuration drift, and drove root-cause analysis and automated remediation that reduced MTTR across the application estate. At Desjardins, I delivered a 6-month engagement building a Python/FastAPI service that continuously validated ~250 Artifactory repositories and fed results into Dynatrace — extending the engagement past its original scope by making the validation logic reusable rather than one-off, and using Kubernetes and ArgoCD to automate on-demand environment provisioning. Both are the kind of "infrastructure and reliability as a product" work your posting describes.

I want to speak directly to the AI-assisted development line in your posting, since it's a genuine strength rather than a checkbox for me: over the past several months at Énergir, I introduced AI-assisted engineering practices into the team's tooling, researching and applying hard scope gates and human-validation checkpoints before any AI-generated code reaches production — and flagged to leadership that the organization lacked equivalent safeguards. That discipline, not just tool use, is what I'd bring to a client engagement.

I'd welcome the opportunity to discuss how this experience applies to your clients' infrastructure needs. Thank you for your consideration.

Sincerely, Marc Berthelette
