

Dear TaskRabbit Hiring Team,

I'm applying for the Sr Software Engineer - Developer Productivity role. Building the tooling and platform practices that make other engineers faster — CI/CD, GitOps, and container orchestration — is core to how I've worked throughout my career, and the ArgoCD/GitOps and Kubernetes/Docker/Helm scope in this posting is squarely in my day-to-day experience.

At Énergir, I standardized CI/CD delivery for 12 application teams across nine distinct runtimes, entering most of them with no prior experience and reverse-engineering how each one actually worked before automating it. I ran recurring enablement sessions with each team after delivering pipeline tooling, turning delivered automation into real adoption rather than shelfware — the same developer-productivity mindset this role describes. At Desjardins, I automated on-demand infrastructure provisioning using Kubernetes and ArgoCD, and built a Python/FastAPI service that continuously validated infrastructure configuration at scale, extending the engagement past its original scope by making the underlying logic reusable.

I also want to highlight direct, current experience with disciplined AI-assisted development: over the past several months at Énergir, I introduced AI-assisted engineering practices into the team's tooling, researching and applying hard scope gates and human-validation checkpoints before any AI-generated code reaches production. That's not theoretical for me — it's a practice I use daily, which maps directly onto the kind of AI-assisted workflows a developer productivity role increasingly needs to support.

I'd welcome the opportunity to discuss how this experience applies to TaskRabbit's platform. Thank you for your consideration.

Sincerely, Marc Berthelette
