

Dear Tecsyst Hiring Team,

I'm applying for the Site Reliability Engineer role on your Network and Security Operations Center team. Reliability engineering for mission-critical SaaS infrastructure — with real ownership over incident response, observability, and automation — is the core of what I've done for the last several years.

At Desjardins, I built a Python/FastAPI service that continuously validated the configuration of roughly 250 Artifactory repositories every four hours, publishing results to Dynatrace, and extended that engagement past its original scope by making the validation logic reusable rather than one-off — the same harness later de-risked the platform's own version upgrade. I also automated on-demand infrastructure provisioning using Kubernetes and ArgoCD. At Énergir, I drove root-cause analysis on critical production incidents and built the proactive monitoring, dashboards, and automated remediation that reduced MTTR across the application estate, alongside leading cloud modernization onto Microsoft Azure with Terraform and Ansible IaC.

I also want to speak directly to the AI-tooling expectation in your posting: over the past several months at Énergir, I introduced AI-assisted engineering practices into the team's tooling — researching and applying hard scope gates and human-validation checkpoints before any AI-generated code reaches production, and flagging to leadership that the organization lacked equivalent safeguards. That's the same disciplined validation posture I'd bring to using tools like Amazon Kiro in your environment.

One gap I want to name honestly: my Kubernetes experience is strong on the provisioning and automation side, but I haven't operated AWS EKS or multi-account AWS environments at the scale this role implies — I'm currently working through CKA certification to deepen that specific area. The reliability-engineering discipline underneath it — incident command, blameless postmortems, automation-first thinking — is where I'm confident I add value immediately.

I'd welcome the opportunity to discuss how this experience applies to Tecsyst's platform. Thank you for your consideration.

Sincerely, Marc Berthelette
