Professional Summary

Senior reliability and platform engineer with 18 years of experience replacing recurring operational work with durable automation. Reduced on-call frequency at Tink from roughly one page every two rotations to one every four or five through root-cause analysis and prevention, including a self-healing response for an unstable Elasticsearch cluster. At Desjardins, built a Python/FastAPI service that gave approximately 250 enterprise Artifactory repositories a continuous health signal and became the regression safety net for a platform upgrade. At Énergir, standardized CI/CD for 12 application teams and drove adoption through working platforms, documentation, and recurring enablement. Brings production incident response, observability, Python, Linux, and financial-services experience, with a consistent bias toward fixing systemic weaknesses instead of repeating manual recovery.

Technical Skills

Reliability Engineering	Incident response, root-cause analysis, automated remediation, on-call operations, runbooks, capacity and performance monitoring
Observability	Dynatrace, Splunk, ELK Stack, PRTG, dashboards, alerting, logs and operational health signals
Platform Engineering	CI/CD standardization, internal developer tooling, GitOps, team enablement, technical documentation
Cloud and Infrastructure	Microsoft Azure, Terraform, Ansible, Puppet, AWS (EC2, S3, Route 53, VPC)
Containers and Delivery	Kubernetes, Docker, ArgoCD, GitHub Actions, Azure DevOps, Jenkins, JFrog Artifactory
Programming and Systems	Python, FastAPI, Bash, C++, Java, SQL, NoSQL, Linux, Windows Server

Work Experience

Énergir — Senior DevOps Engineer

Montréal, QC | September 2021 – Present

- Standardized CI/CD for 12 application teams and 70+ applications across nine runtimes, turning manual and fragile delivery processes into reusable pipelines with built-in quality gates.
- Drove root-cause analysis on critical incidents and built proactive monitoring, dashboards, and automated remediation to reduce Mean Time to Recovery and improve application reliability.
- Rebuilt Salesforce delivery with the official CLI and a validation-sandbox gate, reducing missed deployment windows from a recurring problem to one since launch while establishing a dependable biweekly cadence.
- Separated application-code failures from platform failures in pipeline reporting, making build results self-diagnosing and reducing unnecessary escalation to the platform team.
- Drove adoption across 12 teams without reporting authority through recurring enablement sessions, documentation, and standards that made reliable delivery easier to sustain.

Key technologies: Microsoft Azure, Azure DevOps, GitHub Actions, Terraform, Ansible, Python, Java, Node.js, Databricks, ELK, ServiceNow

Desjardins — Senior DevOps Engineer (Contract)

Montréal, QC (Remote) | October 2025 – March 2026 — concurrent engagement alongside the Énergir role

- Designed and built a Python/FastAPI health service that validated approximately 250 remote Artifactory repositories every four hours and published technology-segmented operational signals to Dynatrace.
- Extended the original configuration-check mandate into a configurable, mostly tool-agnostic validation harness that became the regression safety net for the enterprise Artifactory upgrade.

- Automated on-demand Artifactory environments with Kubernetes and ArgoCD, giving administrators safe, repeatable infrastructure for testing upgrades and configuration changes.
- Built Splunk alerting for out-of-pipeline configuration changes and implemented artifact lifecycle policies, strengthening auditability, compliance, and platform reliability.

Key technologies: Python, FastAPI, JFrog Artifactory, Kubernetes, ArgoCD, GitHub Actions, Dynatrace, Splunk, Docker, Helm

Tink — DevOps Engineer

Montréal, QC | January 2018 – August 2021

- Reduced 24/7 on-call frequency from roughly one page every two rotations to one every four or five through root-cause analysis, prevention, and operational automation.
- Built a self-healing response for an unstable Elasticsearch cluster, connecting monitoring to Bash remediation so a known failure mode no longer required a human page.
- Automated operating-system patching and kernel-update reboots across 600+ servers, reducing the process to a monthly verification check with near-zero downtime.
- Centralized Jenkins Pipeline as Code for 80+ applications across 20+ clients, improving delivery consistency and adding release visibility through Jira integration.
- Conceived and built a software inventory platform for the 600+ server fleet, exposing CVEs, end-of-life software, and SSL/TLS risk directly to product owners.

Key technologies: Jenkins, ELK Stack, Bash, Linux, Puppet, Spacewalk, PRTG, Jira, AWS (EC2, S3, Route 53, VPC)

SOVO Technologies — Lead Technician to Software Engineer

Montréal, QC | November 2008 – December 2017

- Owned company infrastructure, delivered a zero-downtime server relocation, and introduced redundancy that eliminated core single points of failure while managing and training technicians.
- Wrote production software for approximately seven years: a production scheduling platform, a voice-recognition evaluation system, and multilingual dictionary infrastructure.

Key technologies: C++, Java, SQL, Windows Server, Linux, Active Directory, VMware vSphere, networking, backup and recovery

Education

Bachelor of Automated Manufacturing Engineering — École de Technologie Supérieure, Montréal, QC | 2005 – 2016

DCS in Computer Science Technology — Cégep André-Laurendeau, Montréal, QC | 2002 – 2005
