ComPsych Corporation

Re: Senior DevSecOps Engineer (Remote, Canada)

Dear ComPsych Hiring Team,

I'm applying for the Senior DevSecOps Engineer role on your CloudSecOps team. What caught my attention is how specifically the posting describes directing AI to build pipelines and infrastructure while staying accountable for validating what it produces — that's not a hypothetical for me. At Desjardins, I designed and built a Python/FastAPI health-monitoring service, using Claude-driven workflows, that automatically tested the configuration of roughly 250 remote Artifactory repositories every four hours and published results to Dynatrace. I wrote the specs, directed the AI-assisted build, and validated the output before it shipped — then extended the harness well past its original scope to de-risk an enterprise-wide platform upgrade. That's the exact operating model this role describes, not an analogy for it.

On the infrastructure side: at Énergir, I standardized CI/CD and Terraform/Ansible Infrastructure as Code across nine runtimes for 12 application teams and 70+ applications, and drove that adoption through recurring enablement sessions rather than one-off fixes — directly matching your goal of building shared CloudSecOps standards rather than solving the same problem differently per team. At Desjardins, I also built Splunk alerting to catch configuration changes made outside the CI/CD pipeline and implemented artifact lifecycle policies for audit and compliance — the same "security and observability designed in, not caught later" posture your posting describes, which matters given the behavioral-health data your systems carry.

I'm comfortable in both Azure and Kubernetes/container environments in production, and I've carried on-call responsibility for critical production systems throughout my career. I'm incorporated in Canada, fully bilingual, and available immediately.

Best regards,

Marc Berthelette
