Hello,

I am applying for the Lead Cloud Engineer role. Azure has been my main platform for five years, and the role's mix of Terraform, Ansible, Azure DevOps pipelines, Key Vault and identity wiring overlaps with work I have done.

At Énergir I helped a team move its own Nexus, Jenkins and Vault environments from manual Azure portal operations to infrastructure as code. Terraform provisioned the resource groups, networking and VMs, and Ansible configured the hosts and Docker. I later introduced Azure Storage accounts for Terraform state and Azure Key Vault in place of HashiCorp Vault. I also initiated shared Jenkins pipelines in an environment of about 50 developers, 12 teams and 70+ applications, onboarded developers and DevOps engineers, and acted as their primary support contact when delivery broke.

At Desjardins I built a Python/FastAPI workflow that provisioned Artifactory, tested about 250 repositories on a schedule, and ran through ArgoCD with results published to Dynatrace.

To be direct about the gaps, because they are central to this role: my Terraform and Ansible work was inside another team's workflows, and I proposed improvements rather than authoring modules. I have deployed applications to Kubernetes clusters that other teams operate, but I have not run AKS in production, including node pools, policy, ingress or tenant onboarding. I have not built image-factory pipelines, or worked with OpenBao, Backstage or Azure VMware Solution. My Azure networking work has been practical rather than specialist. My leadership has been technical direction without a formal title or direct reports.

I am based in Ontario, bilingual in French and English, incorporated in Canada and available immediately. Could you confirm whether this is a contract or employee role, the expected working hours and time zone, and the pay range? My resume is attached.

Thank you for your consideration.

Marc Berthelette
