Hello,

I am applying for the Site Reliability Engineer – Salesforce contract. The core of the posting, Salesforce deployments through source-controlled pipelines, test reporting to Teams and release support, is the part of my work at Énergir that I am proudest of.

I was asked to replace legacy Salesforce ANT deployment scripts. I moved delivery to the official Salesforce CLI, then built validation that deployed each candidate merge into a dedicated sandbox and ran the full test suite, so problems surfaced before the release rather than in the deployment window. I also built nightly full-suite testing of the develop branch on a platform shared by four to five teams. When two weeks of nightly failures sat unresolved because nobody owned them, I escalated the deployment risk to the project director, fixes followed within 48 hours, and the project deployed on schedule. More recently I moved production Salesforce logging to direct Dynatrace ingestion and built dashboards that exposed errors the team could not previously see.

Around that, I initiated shared Jenkins pipelines for an environment of about 50 developers, 12 teams and 70+ applications, with mandatory quality gates and Teams alerts from scheduled smoke tests. I have worked with Bitbucket for years and used GitHub Actions at Desjardins, where I built a Python/FastAPI workflow that tested about 250 Artifactory repositories on a schedule.

To be direct about the gaps: my Salesforce work is the delivery and validation side, not administration or development. I have not written Apex or Lightning components, configured custom objects, or held Salesforce certifications, and my Salesforce pipelines ran on Jenkins and the CLI rather than GitHub Actions or Bitbucket Pipelines. I am therefore not a match for "five years of Salesforce metadata" as written, but I know how these deployments fail and I have fixed that side of the process. I learn unfamiliar platforms quickly: I entered Salesforce, MuleSoft and Oracle delivery at Énergir with no prior experience.

I am incorporated in Canada, so I can start as a contractor right away, and I am bilingual in French and English. I am based in Smiths Falls, Ontario. Before going further, could you confirm that a contractor in Ontario is eligible, how the release windows from 10pm Pacific are scheduled and how much notice is given, and what the extension outlook is beyond the first four months?

Thank you for your consideration.

Marc Berthelette
