Marc Berthelette

Senior Site Reliability Engineer — Production Monitoring, Incident Response and Automation

Smiths Falls, ON, Canada · Remote · marc.berthelette@gmail.com
marcberthelette.com · LinkedIn
Bilingual: French / English · Incorporated in Canada · Available immediately

Professional Summary

Senior engineer with nearly 18 years across infrastructure, development and operations, working through an incorporated Canadian company. Delivered production reliability through monitoring, root cause analysis, fleet automation and incident response: a 24/7 on-call rotation and 600+ server fleet at Tink, production Salesforce error visibility in Dynatrace at Énergir, and a scheduled validation service for about 250 Artifactory repositories at Desjardins. Reliability experience comes from DevOps roles rather than a formal SRE title.

Technical Skills

Reliability: Incident response, root cause analysis, on-call support, automated remediation, Linux
Observability: Dynatrace, Splunk, ELK, PRTG; Python, FastAPI, Bash
Infrastructure: HAProxy, Active Directory, Puppet, Spacewalk, VMware vSphere, Azure, AWS migration environment
Delivery: Jenkins, GitHub Actions, Azure DevOps, Salesforce CLI, Kubernetes application deployments, ArgoCD

Work Experience

Énergir — Senior DevOps Engineer (Contract)

Montréal, QC | September 2021 – September 2026
Five-year consulting engagement, renewed four times.

- Migrated production Salesforce logging from Logstash to direct Dynatrace ingestion, reproducing existing processing; extracted DML error types, messages and originating classes and built dashboards that exposed previously hidden issues, then transferred ownership to a long-standing Salesforce team member.
- Implemented four-hourly Jenkins smoke tests with Teams alerts to detect external dependency failures, including firewall changes; clarified pipeline-versus-application failure ownership.
- Initiated and defined requirements for an availability dashboard covering Jenkins, Vault, Logstash and Nexus in development and production; a colleague implemented it.
- Separated application-code errors from platform-pipeline errors in build reporting so teams could see whose fix a failure was.
- Built nightly Salesforce validation; escalated two weeks of failures to the project director, prompting fixes across 4–5 teams within 48 hours. The project deployed on schedule.
- Replaced legacy ANT deployment scripts with the official Salesforce CLI and built validation that deployed each candidate merge into a dedicated sandbox and ran the full test suite.
- Initiated shared Jenkins pipelines adopted by all teams already deploying through Jenkins, in an environment of about 50 developers, 12 teams and 70+ applications; achieved approximately 80–90% JaCoCo coverage of shared pipeline code with per-commit unit tests and built sample applications for integration testing.

Key technologies: Jenkins, Azure, Python, Dynatrace, Logstash, JaCoCo, Salesforce CLI, Oracle

Desjardins — Senior DevOps Engineer (Contract)

Montréal, QC (Remote) | October 2025 – March 2026
Concurrent with the Énergir engagement.

- Built a Python/FastAPI workflow that provisioned Artifactory, applied configuration from a selected Git reference, and tested uncached artifact retrieval across approximately 250 repositories.
- Deployed the suite through ArgoCD/GitOps for scheduled execution, publishing configuration-version and artifact-level results to Dynatrace to expose configuration and upstream connectivity failures.
- Implemented artifact retention policies and Splunk alerts for configuration changes made outside CI/CD.

Key technologies: Python, FastAPI, Artifactory, Kubernetes, ArgoCD, Dynatrace, Splunk

Tink — DevOps Engineer

Montréal, QC | January 2018 – August 2021

- Automated PRTG-triggered response to Elasticsearch CPU saturation: attempted a process restart after two minutes and alerted on-call at five minutes if saturation persisted; supported a 24/7 rotation.
- Replaced reactive patching across 600+ servers with staged Spacewalk schedules, environment/role groups, A/B frontend and middleware batches, and dependency-aware reboots.
- Controlled updates through client-specific package repositories; published patch/reboot progress and failures to Rocket.Chat, with existing PRTG monitoring covering service health.
- Built fleet inventory across Unix and Windows servers to identify vulnerable applications and upcoming end-of-life upgrades; added TLS scoring and environment version tracking for Ops, product owners, and QA.
- Built centralized ELK logging and managed fleet configuration with Puppet.
- Built an AWS migration target using console provisioning (EC2, S3, Route 53, VPC, caching and database services); the client cancelled before production cutover.

Key technologies: Linux, Jenkins, Puppet, Spacewalk, PRTG, ELK, AWS, Rocket.Chat

SOVO Technologies — Lead Technician → Software Engineer

Montréal, QC | November 2008 – December 2017

- Led and performed most redundancy work across HAProxy, Active Directory, speech-recognition servers and file services, supported by a second technician, for live-captioning production.
- Supported client requirements allowing at most three minutes of downtime per broadcast and eight seconds from speech to caption; distributed booth PCs across separate switches and provided dual internet links.
- Planned and executed two phased office relocations involving approximately 15–20 workstations. Developed production scheduling and speech-recognition evaluation software.

Key technologies: HAProxy, Active Directory, VMware vSphere, Linux, Windows Server, C++, Java, SQL

Education

Bachelor of Automated Manufacturing Engineering — École de Technologie Supérieure (ÉTS), Montréal | 2016

DCS in Computer Science Technology — Cégep André-Laurendeau, Montréal | 2005
