Stay22 — Hiring Team

Re: DevOps Developer, AI Automation

Hello,

I am applying for the DevOps Developer, AI Automation role. The part of the posting that stood out is the requirement to set guardrails and access controls for AI agents. That is work I have already done, and I would like to do more of it.

Over the past 6–9 months at Énergir I introduced AI-assisted engineering practices into the team's tooling. I researched and applied hard scope gates and human-validation checkpoints before any AI-generated code could reach production, because the speed is only useful if someone is still accountable for what ships. I also told leadership that the organization had no equivalent safeguards for AI-assisted development. That concern was not acted on, which is part of why I am looking for a team that takes it seriously.

The rest of my background is platform and delivery work. I centralized Jenkins CI/CD for about 50 developers across 12 teams and 70+ applications, with mandatory quality gates that developers could not skip, and I separated application failures from platform failures in pipeline reporting so teams could tell at a glance whose problem a failure was. At Desjardins I built a Python/FastAPI service that tested about 250 repositories every four hours and published results to Dynatrace, with Splunk alerting on changes made outside the pipeline. At Énergir I led root-cause analysis on production incidents and built the monitoring and automated remediation that came out of it, and at Tink I built ELK log aggregation and automated recovery for an unstable Elasticsearch cluster.

I want to be clear about where I am thinner than the posting. My Terraform and Ansible work was inside workflows owned by another team, not authoring modules myself. My AWS experience is a hand-built migration environment that the client cancelled before cutover, and I have no GCP experience. I have used GitHub Actions and Jenkins rather than CircleCI, and my Kubernetes work is as an application and platform user, not a cluster owner. In each ecosystem I have entered, I learned it by working out how it actually behaves before automating it, and that is how I would approach yours.

I am based in Ontario, bilingual in French and English, and available immediately. Could you let me know the base salary range and the expected in-office days per week for this role? My resume is attached.

Thank you for your consideration.

Marc Berthelette
