Syntax

Re: Senior Platform Engineer (SRE), AI Solutions

Dear Syntax hiring team,

I am applying for the Senior Platform Engineer (SRE), AI Solutions role. Building the internal platform that lets small pods of developers and AI agents ship fast and operate with confidence is close to work I already do — both the reliability-engineering side and, directly, the AI-assisted-development side.

At Énergir, I drove CI/CD and platform-engineering adoption across 12 application teams and more than 70 applications, standardizing delivery across nine distinct runtimes and running recurring enablement sessions to turn delivered tooling into actual usage rather than shelfware — outside any reporting line. Over the past 6–9 months, I also introduced AI-assisted engineering practices into that team's tooling: researching and applying hard scope gates and human-validation checkpoints before any AI-generated code reaches production. I flagged to leadership that the organization had no equivalent safeguards for AI-assisted development. That is the same discipline your posting asks for — using agentic coding tools daily while keeping a defensible boundary around what reaches production.

At Desjardins, I built a Python/FastAPI service that tested the configuration of roughly 250 enterprise Artifactory repositories every four hours and published the results to Dynatrace, then automated the provisioning of on-demand Artifactory environments with Kubernetes and ArgoCD so administrators could safely test upgrades and configuration changes. I have also led Azure modernization work using Terraform and Ansible to standardize environment provisioning and reduce configuration drift — the same infrastructure-as-code discipline your golden-path blueprints depend on.

I want to be direct about where my Kubernetes depth sits relative to this role. My Kubernetes and ArgoCD experience comes from the provisioning and automation side — building on-demand, repeatable environments — rather than deep CNCF-stack cluster administration, and I have not worked with Backstage specifically. What I bring instead is a demonstrated pattern, at three different employers over eight years, of taking a narrower ask and delivering the structurally larger platform underneath it, plus direct, current experience building the human-validation guardrails that make agentic engineering safe to run in production.

I am based near Ottawa, fully bilingual in English and French, and available to work remotely with Syntax's Montréal-based team.

Sincerely,

Marc Berthelette
