Clio
Re: Systems Engineer, Azure Infrastructure

Dear Clio Hiring Team,

I'm a Senior DevOps Engineer with nearly 20 years of experience building performant, reliable, and scalable infrastructure for enterprise clients -- most recently a 6-month engagement with Desjardins building Kubernetes/ArgoCD-driven environment automation and Splunk-based observability for a large-scale financial-services platform, and prior to that architecting Azure DevOps CI/CD pipelines and standardizing infrastructure with Terraform and Ansible at Energir. That combination of Azure-first platform engineering and Kubernetes production experience maps closely to what your Systems Engineering team is building to support Clio Operate's expansion.

I bring a root-cause-first mindset from my incident response and RCA work at Energir -- reducing MTTR through proactive monitoring and automated remediation -- which aligns with the curiosity and depth you're looking for over strict tool-for-tool matching. My deepest cloud platform expertise is Azure, and while I don't have direct DataDog or C# experience, the underlying observability and automation discipline transfers directly.

I'm based in Smiths Falls, ON -- within Eastern Canada and available to work remotely per the role's location requirements -- incorporated, and available to discuss fit.

Best regards,

Marc Berthelette
