EPAM
Re: Site Reliability Engineer (SRE)

Dear EPAM Hiring Team,

I'm a Senior DevOps Engineer with nearly 18 years of experience building and operating reliable, observable infrastructure for enterprise clients -- most recently a 6-month engagement with Desjardins where I built Dynatrace dashboards and Splunk-based alerting to give real-time visibility into platform health and catch configuration drift outside the CI/CD pipeline. That direct experience with the exact observability stack this role calls for -- Dynatrace and Splunk -- is what drew me to this posting specifically.

At Energir, I architected CI/CD pipelines on Azure DevOps and drove RCA-based incident response to reduce MTTR and improve system reliability, while also automating environment provisioning with Kubernetes and ArgoCD to support high-availability production systems. My deepest cloud platform experience is Microsoft Azure, which fits well within your flexible cloud-provider requirement.

I'm based remotely in Canada, incorporated, and available to discuss fit for this role.

Best regards,

Marc Berthelette
