Figment Inc.
Re: Senior DevOps Engineer

Dear Figment Hiring Team,

I'm a Senior DevOps Engineer with nearly 18 years of experience building and operating secure, automated infrastructure -- most recently a 6-month engagement with Desjardins where I partnered with security teams to build Splunk-based alerting enforcing pipeline-only configuration changes, and automated environment provisioning with Kubernetes and ArgoCD. That security-first, automation-driven approach to infrastructure maps directly to the CI/CD and release-pipeline work described in this role.

At Energir, I standardized Infrastructure as Code with Terraform and Ansible across dev, staging, and production, and drove RCA-based incident response to reduce MTTR -- directly relevant to the on-call and operational-clarity responsibilities here. I also want to speak to the agentic AI workflow experience you're looking for: I build with AI using a spec-driven development approach -- starting with a product overview, breaking it into stories that get planned and implemented one at a time, with markdown files giving tools like Claude Code real continuity across a project, backed by coding-standard configuration files and CI/CD quality gates to maintain the same stability and trust a human-reviewed pipeline would carry.

While I don't have direct blockchain validator operations experience, the underlying platform engineering discipline -- Linux administration, Terraform/Ansible IaC, CI/CD, and security-partnered operations -- transfers directly, and I'm genuinely excited by the opportunity to apply that experience to Web3 infrastructure at scale.

I'm based remotely in Canada, incorporated, and available to discuss fit for this role.

Best regards,

Marc Berthelette
