Velora
Re: Senior DevOps Engineer/Platform Engineer

Dear Velora Hiring Team,

I'm a Senior DevOps Engineer with nearly 18 years of experience building internal platform capabilities that let engineering teams ship safely and independently -- most recently a 6-month engagement with Desjardins hardening the JFrog Artifactory platform, where I built Kubernetes/ArgoCD-driven self-service environment provisioning, governance tooling, and Splunk-based alerting to keep changes pipeline-only and auditable. That focus on reducing DevOps bottlenecks through self-service tooling is exactly the mandate described for this role.

At Energir, I standardized Infrastructure as Code with Terraform and Ansible, and drove RCA-based incident response and reliability improvements to reduce MTTR -- directly relevant to the SLO ownership and on-call responsibilities here. My deepest cloud platform experience is Microsoft Azure rather than GCP, but the underlying platform engineering discipline -- Terraform, Kubernetes/Helm, self-service tooling, and reliability engineering -- transfers directly, and I'm genuinely energized by the opportunity to build GCP depth alongside AWS and Azure.

I'm based in Smiths Falls, ON, incorporated, and available for remote work within your eligible provinces. I'd welcome the opportunity to discuss fit further.

Best regards,

Marc Berthelette
