Quantum Technologies LLC

Re: Cloud & Application Platform Engineer

Dear Quantum Technologies hiring team,

I am applying for the Cloud & Application Platform Engineer role. The combination of cloud-native application migration, certificate and access governance, and disciplined change management is close to work I already do in regulated enterprise environments.

At Desjardins, I automated the provisioning of on-demand Artifactory environments using Kubernetes and ArgoCD, giving administrators repeatable, isolated environments for safely testing configuration changes and upgrades. I also implemented artifact lifecycle policies to enforce retention standards and built Splunk alerting to detect manual configuration changes made outside the CI/CD pipeline — the same discipline your posting asks for around certificate lifecycle management and access control review: keep the platform's security posture provable, not assumed.

At Énergir, I led cloud modernization work migrating several mission-critical services to Microsoft Azure, standardizing environment provisioning with Terraform and Ansible. I also run production change through formal governance — using ServiceNow for release and incident processes across 12 application teams — so the ServiceNow Change Management component of this role maps directly onto how I already operate.

My OpenShift experience comes from adjacent ground — deep, current Kubernetes and ArgoCD work rather than OpenShift's own tooling — and my Java/.NET work sits earlier in my background. What I bring is 18 years of learning the specific platform under a delivery deadline and building the governance around it that makes a system provably reliable, not just working today.

I am based near Ottawa, fully bilingual in English and French, and available to discuss remote work arrangements and contract terms.

Sincerely,

Marc Berthelette
