Tyk

Re: Site Reliability Engineer

Dear Tyk hiring team,

I am applying for the Site Reliability Engineer role. Operating a global platform under SLAs, driving down incident load through automation, and building the monitoring that makes reliability measurable rather than assumed is work I have direct, repeated experience doing.

At Tink, I was part of a 24/7 on-call rotation supporting all production systems across a fleet of 600+ servers, and drove root-cause analysis and preventive engineering that reduced paging frequency from roughly one page every two rotations to one every four or five. I also built a self-healing response for a recurring, unstable Elasticsearch cluster: monitoring detected when the service became unresponsive and automatically triggered a remediation script to restart it — a known failure mode that no longer needed a human paged to fix it manually. That is exactly the pattern your posting describes: automate the routine operational task so the team's attention goes to what actually needs a person.

At Desjardins, I automated the provisioning of on-demand Kubernetes environments with ArgoCD, and at Énergir I drove root-cause analysis on critical production incidents while building the proactive monitoring, dashboards, and automated remediation that reduced Mean Time to Recovery across an estate of 70+ applications — the same discipline of documented post-incident analysis and continuous improvement your team runs on.

I want to be direct about two gaps. My Kubernetes experience is real and current, but on the provisioning and automation side rather than production-scale multi-cloud cluster operation at Tyk's implied scope, and my AWS depth comes from a hands-on but dated and non-production build at Tink — EC2, S3, Route 53, VPC, and self-managed caching, built with no prior AWS experience but never operated at production scale, and provisioned by hand rather than with Terraform. I also have no production Go experience or MongoDB/Redis cluster administration specifically; my scripting and automation work has been in Python and Bash. I would rather name these plainly than have them surface as a surprise in interview.

What I bring instead is 18 years of taking ownership of reliability problems other people are hesitant to touch, a demonstrated record of learning unfamiliar platforms cold under a delivery deadline, and direct evidence — the Elasticsearch self-healing work, the paging-frequency reduction — that I build the automation that actually reduces operational toil, not just dashboards that describe it.

I am based near Ottawa, fully bilingual in English and French, and available to work remotely across the on-call rotation.

Sincerely,

Marc Berthelette
