Professional Summary

Senior site reliability and platform engineer with 18 years of experience reducing operational toil through automation and root-cause-driven prevention. At Tink, cut on-call paging frequency roughly in half through RCA and built self-healing automation for an unstable Elasticsearch cluster. At Énergir, drives root-cause analysis and automated remediation across 70+ applications, reducing MTTR. At Desjardins, automated Kubernetes environment provisioning with ArgoCD. Deep observability practice (Dynatrace, Splunk, ELK Stack), current Terraform and Ansible IaC, and a demonstrated pattern of learning unfamiliar platforms cold under a delivery deadline — including a hands-on, no-prior-experience AWS build at Tink.

Technical Skills

Site Reliability Engineering	24/7 on-call, incident response, root-cause analysis, post-incident reviews, MTTR reduction, automated remediation, self-healing automation
Containers & Orchestration	Kubernetes, Docker, ArgoCD — environment provisioning and automation
Observability	Dynatrace, Splunk, ELK Stack (Elasticsearch, Logstash, Kibana), PRTG, dashboards, alerting
Infrastructure as Code	Terraform, Ansible, Puppet, Spacewalk
Cloud Platforms	Microsoft Azure (production, 5–10 service migrations led), AWS (EC2, S3, Route 53, VPC — hands-on build, non-production, see Work Experience)
Programming & Automation	Python, FastAPI, Bash, Java, SQL, NoSQL
Systems & Networking	Red Hat Linux, CentOS, Rocky Linux, Ubuntu, NetScaler, Cisco routing, firewall/VPN administration

Work Experience

Énergir — Senior DevOps Engineer

Montréal, QC | September 2021 – Present

- Drove root-cause analysis on critical production incidents and built proactive monitoring, dashboards, alerts, and automated remediation that reduced MTTR across 12 application teams and 70+ applications.
- Led cloud modernization migrating several mission-critical services to Microsoft Azure, implementing Terraform and Ansible IaC practices that standardized environment provisioning and reduced configuration drift.
- Standardized CI/CD delivery across nine distinct runtimes, entering most ecosystems with no prior experience and reverse-engineering each before automating it.

Key technologies: Microsoft Azure, Terraform, Ansible, Python, Dynatrace, Splunk, Azure DevOps, GitHub Actions

Desjardins — Senior DevOps Engineer (Contract)

Montréal, QC (Remote) | October 2025 – March 2026 — *concurrent engagement alongside the Énergir role*

- Automated provisioning of on-demand environments using Kubernetes and ArgoCD, giving administrators repeatable, isolated environments for safely testing configuration changes and upgrades.
- Designed and built a Python/FastAPI service that tested the configuration of ~250 enterprise Artifactory repositories every 4 hours and published results to Dynatrace.
- Built Splunk alerting to detect manual configuration changes made outside the CI/CD pipeline.

Key technologies: Kubernetes, ArgoCD, Python, FastAPI, Dynatrace, Splunk, Docker, Helm

Tink — DevOps Engineer

Montréal, QC | January 2018 – August 2021

- Participated in 24/7 on-call for all production systems and reduced paging frequency from roughly one page every two rotations to one every four or five through root-cause analysis and preventive engineering.

- Built self-healing automation for a recurring, unstable Elasticsearch cluster — monitoring detected when the service became unresponsive and automatically triggered a Bash remediation script to restart it, so a known failure mode no longer required a human page.
- Implemented centralized ELK Stack logging and alerting across a fleet of 600+ Linux servers to accelerate incident diagnosis.
- Built the compute, caching, and database layers of a client's full AWS migration target environment — EC2, S3, Route 53, self-managed memcached, serverless relational database — with no prior AWS experience; the client cancelled the migration before cutover, and resources were provisioned by hand rather than through Terraform or CloudFormation.
- Managed fleet configuration as code via Puppet and Spacewalk, including automated kernel-update reboots reduced to a monthly verification check with near-zero downtime.

Key technologies: ELK Stack, Bash, AWS (EC2, S3, Route 53, VPC), Puppet, Spacewalk, Linux, networking, incident response

SOVO Technologies — Lead Technician to Software Engineer

Montréal, QC | November 2008 – December 2017

- Owned company IT infrastructure, delivered a zero-downtime server relocation, and introduced redundancy that eliminated single points of failure.
- Wrote production software for approximately seven years before the title formalized it.

Key technologies: C++, Java, SQL, Windows Server, VMware vSphere, Active Directory

Education

Bachelor of Automated Manufacturing Engineering — École de Technologie Supérieure, Montréal, QC | 2005 – 2016

DCS in Computer Science Technology — Cégep André-Laurendeau, Montréal, QC | 2002 – 2005
