Banyan Software Re: Senior SRE (Modernized Application Operations)

Dear Banyan Hiring Team,

I'm applying for the Senior SRE role supporting your portfolio's modernized applications. Reliability work across systems I didn't build myself is a pattern I've repeated for 18 years: at Desjardins, I designed a Python/FastAPI service that continuously validated the configuration of roughly 250 enterprise JFrog repositories and published results to Dynatrace, then extended it into the regression-safety net for the platform's version upgrade. At Énergir, I drove root-cause analysis on production incidents and built the monitoring and automated remediation that reduced MTTR across 70+ applications. Both required learning platforms I hadn't touched before under a delivery clock — the same posture this role needs across a growing set of acquired products.

Terraform and Azure are where I run deepest — years of infrastructure-as-code standardization at Énergir — and I've operated Kubernetes and ArgoCD in production at Desjardins, alongside Dynatrace and Splunk observability. I've also spent the past several months applying AI-assisted engineering practices at Énergir, including Claude Code, with explicit scope gates and human-validation checkpoints before generated code reaches production — I'd bring that same disciplined approach to building the AI agents this role calls for. I'm comfortable with on-call rotations: I carried 24/7 production coverage at Tink for a fleet of 600+ servers.

One gap worth naming directly: my Kubernetes depth is real but not at the "mastery" level, and I haven't worked in Go. Everything else in the posting — Python, Terraform at scale, AWS and Azure production experience, CI/CD, APM tooling — maps directly onto work I've already shipped.

I'm incorporated in Canada, fully bilingual (French/English), and available to start immediately on a remote basis.

Best regards,

Marc Berthelette
