

Dear Barracuda Hiring Team,

I am applying for the Cloud Site Reliability Senior Engineer role because its combination of Azure infrastructure, Terraform, Kubernetes, observability, and developer self-service closely matches the platform work I have led throughout my career. I bring 18 years across software, systems, and DevOps engineering, with deep Microsoft Azure, infrastructure automation, CI/CD, incident response, and production-reliability experience.

At Desjardins, I was initially asked to verify the configuration of roughly 250 enterprise JFrog repositories. I delivered a Python/FastAPI service that tested them every four hours and published continuous health signals to Dynatrace, but I also made its validation engine tool-agnostic and its tests configurable. That broader design enabled administrator self-service and became the regression-safety net for a major platform upgrade. I also automated on-demand Artifactory environments using Kubernetes and ArgoCD, giving administrators safe, repeatable environments for testing changes.

At Energir, I standardized CI/CD across 12 teams, nine runtimes, and more than 70 applications. I led Azure modernization using Terraform and Ansible, improved pipeline diagnostics, and built monitoring and automated remediation to reduce recovery time. I also drove adoption outside any reporting line through recurring enablement sessions, which maps directly to Barracuda's expectation that this engineer establish best practices and help application teams use infrastructure through self-service patterns.

My Kubernetes work includes production delivery and environment automation rather than years of owning a large multi-region, multi-cluster platform, and I would not overstate that distinction. What I bring is extensive Azure and Terraform depth, strong observability and incident judgment, and a repeated ability to learn unfamiliar systems under a delivery deadline. I would welcome the opportunity to help Barracuda improve its cloud platform, reduce alert noise, and balance reliability, performance, cost, and delivery speed.

Sincerely,

Marc Berthelette
