

Dear Case IQ Hiring Team,

I am applying for the DevOps Engineer role because its combination of Azure infrastructure, reliable delivery, observability, and governed AI-assisted operations closely matches my recent work. I bring 18 years across software, systems, and DevOps engineering, with deep Microsoft Azure, Terraform, CI/CD, production reliability, and cross-team enablement experience in regulated enterprise environments.

At Desjardins, I was initially asked to verify the configuration of roughly 250 enterprise JFrog repositories. I delivered a Python/FastAPI service that tested them every four hours and published continuous health signals to Dynatrace, but I also made the validation engine tool-agnostic and its tests configurable. That broader design enabled administrator self-service and became the regression-safety net for the platform's version upgrade. It reflects the judgment I would bring to Case IQ: solve the immediate operational problem while building the reusable controls and visibility the wider platform needs.

At Energir, I standardized CI/CD across 12 teams, nine runtimes, and more than 70 applications. I led Azure modernization work using Terraform and Ansible, improved pipeline diagnostics, and built monitoring and automated remediation to reduce recovery time. I also introduced AI-assisted engineering practices with hard scope gates and human-validation checkpoints before generated code could reach production—an approach directly relevant to responsible agentic SDLC and AIOps adoption.

My Azure experience is deeper and more recent than my AWS experience. At Tink, I spent roughly six months building the compute, caching, database, VPC, and Route 53 layers of an AWS migration target; the client cancelled the initiative before production cutover, and the resources were provisioned manually rather than through IaC. I would bring that honest foundation alongside proven experience learning unfamiliar platforms under deadlines, rather than overstating production ownership of services I have not operated deeply. I would welcome the opportunity to help Case IQ improve platform reliability, delivery automation, security, and AI-enabled operations.

Sincerely,

Marc Berthelette
