

Dear Clario Hiring Team,

I am applying for the Senior DevOps Engineer role because its focus on enterprise delivery platforms, reliability, and security in a regulated environment closely matches the work I have led throughout my career. I bring 18 years of infrastructure and software experience, including standardizing CI/CD across large application estates, automating production operations, improving observability, and mentoring teams toward safer delivery practices.

At Energir, I standardized CI/CD across 12 teams, nine runtimes, and more than 70 applications. I led Azure modernization work using Terraform and Ansible, built monitoring and automated remediation, and made pipeline failures easier to diagnose by separating application errors from platform issues. I also ran recurring enablement sessions so teams could adopt the new delivery patterns independently—experience directly relevant to Clario's need for technical leadership across development, operations, and security.

At Desjardins, I built a Python/FastAPI service that validated approximately 250 enterprise JFrog repositories every four hours and sent continuous health signals to Dynatrace. Its configurable, tool-agnostic design became the regression-safety net for an enterprise upgrade. I also automated on-demand environments with Kubernetes and ArgoCD and added Splunk alerts for out-of-band configuration changes. Earlier at Tink, I centralized Jenkins pipelines for more than 80 applications and automated patching and reboots across a 600-server fleet with Puppet, while root-cause and self-healing work substantially reduced on-call interruptions.

My deepest recent cloud experience is with Microsoft Azure. I also built an AWS migration target using EC2, S3, Route 53, VPC, caching, and a serverless relational database, although the client cancelled before production cutover. Likewise, my Kubernetes experience is strongest in delivery automation and repeatable test environments rather than years of owning very large clusters. I would bring that candour alongside proven depth in CI/CD, infrastructure as code, Linux automation, observability, incident response, and cross-team platform leadership.

I would welcome the opportunity to help Clario strengthen the secure and resilient platforms behind its clinical research products.

Sincerely,

Marc Berthelette
