

Dear ClearGov Hiring Team,

I'm applying for the Senior DevOps Engineer role. The opportunity to improve developer self-service, reliability, infrastructure automation, and AI-enabled operational practices for a public-sector financial platform closely matches the work I have delivered across regulated financial-services and energy environments.

At Desjardins, I was asked to verify the configuration of roughly 250 enterprise JFrog repositories. I delivered a Python/FastAPI monitoring service, but designed its validation logic to be tool-agnostic and its test set configurable. That larger design gave platform administrators a continuous health signal in Dynatrace and became the regression-safety net for the enterprise JFrog upgrade. It is the same approach I would bring to ClearGov's developer self-service work: understand the immediate request, then build the durable platform capability that removes recurring toil.

At Énergir, I standardized CI/CD across 12 teams and 70+ applications, implemented Terraform and Ansible infrastructure automation on Microsoft Azure, and drove incident RCA, observability, and automated remediation. I also introduced AI-assisted engineering practices with hard scope gates and human-validation checkpoints before generated code can reach production—directly relevant to your goal of adopting AI tooling with appropriate security and change-management guardrails.

I want to be precise about AWS. At Tink, I spent roughly six months building a client's AWS migration target across EC2, S3, Route 53, VPC, self-managed memcached, and a serverless relational database. The client cancelled the migration before cutover, and the resources were provisioned through the console rather than IaC. My deepest cloud and Terraform experience is on Azure, but that AWS build gives me a real foundation, while 18 years of repeatedly learning unfamiliar systems under delivery pressure demonstrates how I close platform-specific gaps.

I would welcome the opportunity to discuss how this combination of infrastructure judgment, developer enablement, reliability engineering, and responsible AI adoption could contribute to ClearGov. Thank you for your consideration.

Sincerely, Marc Berthelette
