

Dear commonsku Hiring Team,

I am applying for the DevOps Engineer II role because its focus on dependable infrastructure, delivery automation, observability, and a better developer experience closely matches the work I have led throughout my career. I bring 18 years across software, systems, and DevOps engineering, with a track record of replacing fragile manual processes with reusable tooling that helps product teams move safely and independently.

At Energir, I standardized CI/CD across 12 teams, nine runtimes, and more than 70 applications. I led Azure modernization using Terraform and Ansible, introduced reusable pipelines with built-in quality gates, and made failures easier to diagnose by distinguishing application issues from platform failures. I also ran recurring enablement sessions, giving teams both the tooling and the understanding needed to own their delivery workflows.

At Desjardins, I built a Python/FastAPI service that validated approximately 250 enterprise JFrog repositories every four hours and published continuous health signals to Dynatrace. Its configurable, tool-agnostic design enabled administrator self-service and became the regression-safety net for a major platform upgrade. Earlier at Tink, I centralized Jenkins pipelines for more than 80 applications, automated operations across 600 servers, and used root-cause analysis and self-healing automation to substantially reduce on-call interruptions.

My strongest recent cloud depth is in Microsoft Azure rather than AWS. I did build an AWS migration target using EC2, S3, Route 53, VPC, caching, and a serverless relational database, although the client cancelled before production cutover. I recognize that my overall experience exceeds the stated level of this role; I am applying because I value hands-on platform work, close collaboration, and the opportunity to help a growing product team establish durable engineering practices.

I would welcome the opportunity to help commonsku strengthen its delivery systems, infrastructure automation, observability, and developer experience.

Sincerely,

Marc Berthelette
