

Dear Kinaxis Hiring Team,

I am applying for the Cloud Engineer II, Site Reliability Engineering role because its combination of production reliability, infrastructure as code, deployment automation, and operational tooling closely matches my recent work. I bring 18 years across software, systems, and DevOps engineering, including extensive hands-on experience with Terraform, GitHub Actions, ArgoCD, Ansible, Python, Bash, observability, incident response, and developer enablement.

At Energir, I standardized CI/CD across 12 teams, nine runtimes, and more than 70 applications. I led Azure modernization using Terraform and Ansible, built monitoring and automated remediation, and made pipeline failures self-diagnosing by distinguishing application issues from platform failures. I also ran recurring enablement sessions so teams could adopt and own the new delivery practices independently.

At Desjardins, I built a Python/FastAPI service that validated approximately 250 enterprise JFrog repositories every four hours and published continuous health signals to Dynatrace. I automated on-demand environments with Kubernetes and ArgoCD, added Splunk alerts for configuration changes made outside the delivery pipeline, and designed the validation engine to become the regression-safety net for a major platform upgrade. Earlier at Tink, root-cause analysis and self-healing automation substantially reduced on-call interruptions across a 600-server environment.

I recognize that my experience exceeds the stated 2–4-year level. I am nevertheless interested because the role is grounded in the hands-on reliability, automation, troubleshooting, and cross-team work I enjoy. My deepest cloud experience is with Microsoft Azure, and I would bring that strength alongside proven ability to learn new production environments quickly. As a Smiths Falls resident, I would also want to confirm whether the position would be classified as remote or Ottawa-hybrid.

I would welcome the opportunity to help Kinaxis improve the reliability and operational efficiency of its SaaS platform.

Sincerely,

Marc Berthelette
