

Dear Spellbook Hiring Team,

I am applying for the Senior Software Engineer, Platform & Infrastructure role because its focus on reliable foundations, developer experience, and scaling a fast-moving product closely matches the platform work I have led throughout my career. I bring 18 years across software, systems, and DevOps engineering, including large-scale CI/CD, infrastructure automation, observability, incident response, and reusable tooling that lets development teams move faster without sacrificing reliability.

At Energir, I standardized CI/CD across 12 teams, nine runtimes, and more than 70 applications. I led Azure modernization using Terraform and Ansible, improved pipeline diagnostics, and built monitoring and automated remediation to reduce recovery time. Just as importantly, I ran recurring enablement sessions and designed delivery patterns teams could use independently—experience directly relevant to improving Spellbook's build tooling and developer workflows.

At Desjardins, I built a Python/FastAPI service that validated approximately 250 enterprise JFrog repositories every four hours and published continuous health signals to Dynatrace. I designed its validation engine to be configurable and tool-agnostic, allowing administrators to extend it themselves and turning it into the regression-safety net for a major platform upgrade. Earlier at Tink, I centralized Jenkins pipelines for more than 80 applications, automated operations across 600 servers, and used root-cause analysis and self-healing automation to substantially reduce on-call interruptions.

My strongest recent cloud depth is in Microsoft Azure rather than AWS. I did build an AWS migration target using EC2, S3, Route 53, VPC, caching, and a serverless relational database, although the project was cancelled before production cutover. I also do not claim deep MongoDB or Node.js/TypeScript backend experience. What I bring is a strong software foundation, proven platform judgment, and a track record of learning unfamiliar systems quickly while improving reliability, observability, and developer productivity.

I would welcome the opportunity to help Spellbook build the platform foundations its growing engineering team and legal-AI product need to scale.

Sincerely,

Marc Berthelette
