Techso Re: DevOps Specialist (AWS/Azure Cloud)

Dear Techso Hiring Team,

I'm applying for the DevOps Specialist role. Multi-client delivery is exactly the shape of my last three engagements: at Tink, I centralized CI/CD tooling across a team maintaining 80+ applications for 20+ clients, standardizing pipeline steps regardless of the underlying stack. At Énergir, I've done the same across 12 internal teams and nine distinct runtimes — entering ecosystems I'd never touched (Salesforce, MuleSoft, Databricks, Oracle) and reverse-engineering each one before automating it. That pattern of walking into unfamiliar client environments and delivering a working answer quickly is what your aerospace, automotive, and finance client mix will need.

Azure is my deepest platform — years of Terraform and Ansible infrastructure-as-code, environment provisioning, and configuration-drift reduction at Énergir — and I've built a full AWS target environment from scratch (EC2, S3, Route 53, VPC) at Tink, so I can speak to both clouds from direct build experience, not just familiarity. I run Kubernetes and ArgoCD in production at Desjardins, and I've delivered enablement sessions and documentation for engineering teams as a standard part of my work — the training component your role calls for isn't new to me.

I'm bilingual French/English, incorporated in Canada, and based close enough to Montréal to work a hybrid schedule comfortably.

Best regards,

Marc Berthelette
