Crossing Hurdles — Hiring Team (client: Turing)

Re: Senior SWE – Python / TypeScript (AI benchmarking and evaluation, 3-month contract)

Hello,

I am applying for the Senior SWE role supporting Turing's AI benchmarking and evaluation work. I should be direct about fit: my background is Python pipelines, validation tooling and infrastructure, not preference-data collection or rubric design, and my day-to-day language is Python rather than TypeScript. What I can offer is the part of the role that is about building evaluation machinery and judging quality.

At Desjardins I was asked to verify that repositories were configured correctly. I built a Python/FastAPI service that tested about 250 repositories across seven package ecosystems every four hours, then made the validation logic tool-agnostic and the test set configurable so administrators could add their own cases. That harness later became the regression safety net for a major platform upgrade. At Énergir I separated application failures from platform failures in pipeline reporting, so each team could see immediately whether a result was theirs to fix, and I introduced AI-assisted engineering with scope gates and human-validation checkpoints before generated code ships.

I have written production software for roughly seven years, work comfortably in ambiguous, fast-moving environments, and communicate clearly in writing. I am based in Canada, can start immediately, and can commit up to 40 hours a week with the required overlap with Pacific time.

Thank you for your consideration. My resume is attached.
