Clariti Cloud Inc.

Re: Forward Deployed Engineer

Dear Clariti hiring team,

I am applying for the Forward Deployed Engineer role. Owning a technical implementation end to end — data migration, stakeholder translation, and building the tooling that makes the second and third customer faster than the first — is a pattern I've lived three times over eight years, at three different employers.

At Énergir, I was asked to port legacy Salesforce ANT deployment scripts. I delivered the official Salesforce CLI migration plus a validation-sandbox gate that made bad deployments structurally unable to reach production, and I orchestrated integration between Salesforce and the enterprise Data Lake to support secure, automated data pipelines. At Desjardins, I was asked to verify the configuration of roughly 250 enterprise repositories; I built a tool-agnostic, configurable validation harness instead, which then became the regression safety net for the platform's own version upgrade. At Tink, nobody asked for anything — I built a fleet-wide software inventory platform that surfaced security and obsolescence risk to product owners who'd never had that visibility. In each case, the real deliverable turned out to be larger than the request, because I built it to be reusable by the next person, not just to close the ticket.

I also already work the way your team describes: I introduced AI-assisted engineering practices into my own delivery at Énergir over the past several months, with researched scope gates and human-validation checkpoints before any AI-generated code reaches production — not a policy handed to me, work I built myself and then flagged to leadership as a gap in the organization's own safeguards.

I want to be direct about where this role stretches me. My production coding depth is in Python and Bash, not TypeScript, and my customer-facing delivery experience has been internal stakeholders and cross-team enablement rather than a formal Forward-Deployed or solutions-engineering seat sitting with external, non-technical customers. What I bring instead is strong SQL and data-integration instincts from real production work, and a demonstrated record of being the person who builds the playbook rather than just following one.

I am based near Ottawa, fully bilingual in English and French — a real asset for a govtech company serving Canadian municipalities — and open to occasional travel.

Sincerely,

Marc Berthelette
