Docebo

Re: Founding Forward Deployed Engineer

Dear Docebo hiring team,

I am applying for the Founding Forward Deployed Engineer role. Building a function from zero with no playbook, working directly with customers to turn ambiguous problems into reusable platform capability, and applying disciplined judgment to AI-assisted delivery is a combination I have real, direct evidence for.

At Tink, nobody asked me to build anything — I conceived and built, unprompted, a fleet-wide software inventory platform that surfaced CVE exposure, end-of-life software, and SSL/TLS risk to product owners who had no such visibility before. That is the founder mindset your posting describes: no spec, no hand-off, just a gap I decided to close and then made durable enough for others to depend on. At Énergir and Desjardins, I've repeated the pattern — asked to verify configuration or port deployment scripts, and delivering a validation harness or CLI migration that became the platform other teams built on.

The AI-native discipline you're describing is also work I already do, not a direction I'd be learning. Over the past several months I introduced AI-assisted engineering practices into my own delivery at Énergir — researching and applying hard scope gates and human-validation checkpoints before any AI-generated code reaches production — and flagged to leadership that the organization had no equivalent safeguards of its own.

I want to be direct about the core technical stack. Your posting is explicit about React, TypeScript, and Next.js on the frontend, and my production coding depth is Python, FastAPI, and Bash — I don't have hands-on frontend framework experience to offer. My systems architecture background is real (Azure-first, with a hands-on but dated, non-production AWS build at Tink, plus current Kubernetes/ArgoCD automation), but the full-stack craftsmanship this role asks for isn't where my strength sits. I'd rather say that plainly than have it surface mid-interview.

What I bring instead is a demonstrated record of thriving in ambiguity, translating customer-facing problems into durable platform work, and applying the same AI-assisted engineering discipline your FDE function is built around.

I am based near Ottawa, fully bilingual in English and French, and open to discussing the role's on-site expectations.

Sincerely,

Marc Berthelette
