Penn Interactive

Re: Senior Site Reliability Engineer

Dear Penn Interactive hiring team,

I am applying for the Senior Site Reliability Engineer role. Owning critical infrastructure across a regulated, multi-jurisdiction production environment, driving complex migrations with high autonomy, and building the platform tooling that reduces toil for other teams is work I already do.

At Énergir, I led cloud modernization migrating several mission-critical services to Microsoft Azure, implementing Terraform and Ansible IaC practices that standardized environment provisioning and eliminated configuration drift across dev, staging, and production — driven end to end, outside any reporting line, across 12 application teams. At Desjardins, I automated on-demand environment provisioning using Kubernetes and ArgoCD, and built the observability and Splunk-based alerting that caught configuration drift before it became an incident. In both roles I've operated in genuinely regulated environments — financial services and energy — where compliance and auditability aren't optional, the same operating discipline your multi-jurisdiction gaming platform requires.

Root-cause analysis and reducing operational toil through automation is where I spend most of my time. At Tink, I drove down on-call paging frequency by roughly half through prevention, and built a self-healing response for a recurring, unstable Elasticsearch cluster so a known failure mode no longer needed a human page — the exact pattern of "reduce toil through automation" your team is asking for.

I want to name the two places I'd be stretching. My Kubernetes experience is real and current, but on the provisioning and automation side rather than deep production cluster lifecycle management — networking, storage, scheduling at the scale you're describing. My hands-on cloud depth is Azure-first; my AWS experience is a genuine, no-prior-experience build at Tink that never reached production and was provisioned by hand rather than with Terraform, and I have no GCP exposure at all. I'd rather be direct about that than have it surface as a surprise later.

What I bring instead is 18 years of taking ownership of infrastructure problems other people are hesitant to touch, real regulated-environment operating experience, and a demonstrated record of leading cross-team infrastructure work with autonomy.

I am based near Ottawa, fully bilingual in English and French, and available to work remotely.

Sincerely,

Marc Berthelette
