

Dear CTO.ai Hiring Team,

I'm applying for the Senior Software Engineer (Platform - DevOps) role. Building tooling that makes other engineering teams faster and more self-sufficient is work I've done repeatedly throughout my career, and it's what drew me to a platform-for-building-platforms mission.

At Énergir, I standardized CI/CD delivery for 12 application teams across nine distinct runtimes — entering most of them with no prior experience, reverse-engineering how they actually worked, then automating what I found. I didn't just deliver the pipelines; I ran recurring enablement sessions with each team afterward to turn delivered tooling into real adoption instead of shelfware, working across 12 teams outside any reporting line. At Desjardins, I built a Python/FastAPI service that continuously validated infrastructure configuration at scale and made the validation logic reusable and configurable rather than one-off, so other administrators could extend it themselves — the same self-service, developer-experience-first instinct that seems to be at the center of what CTO.ai builds.

I also bring recent, hands-on experience with disciplined AI-assisted engineering: over the past several months, I introduced scoped AI-assisted development practices at Énergir, including hard scope gates and human-validation checkpoints before AI-generated code reaches production. Given developer platforms increasingly need to account for how engineers actually work day to day, I'd bring that same practical, safety-conscious lens to CTO.ai's product.

I'd welcome the chance to learn more about the specific role and team. Thank you for your consideration.

Sincerely, Marc Berthelette
