

Dear Hiring Team,

I'm writing about the Senior Azure Integration Developer contract supporting your non-profit client's cloud environment. My background is centered on Microsoft Azure infrastructure and automation rather than integration development specifically, and I want to be upfront about that distinction while making the case for where my experience does transfer.

At Énergir, I led cloud modernization work migrating several mission-critical services onto Microsoft Azure, building Terraform and Ansible infrastructure as code that eliminated configuration drift across dev, staging, and production. I also orchestrated integration between Salesforce and enterprise Data Lake platforms to support automated, secure data pipelines — directly relevant experience in designing data movement and system-to-system connectivity, even though my usual tooling has been infrastructure-as-code rather than Logic Apps or Data Factory specifically. At Desjardins, I built a Python/FastAPI service that continuously tested and validated the configuration of roughly 250 remote repositories, publishing results into Dynatrace — production experience with the kind of scripted automation and API-driven integration this role likely requires day to day.

I haven't worked hands-on with Azure Functions, Logic Apps, or Azure Data Factory specifically, though I have deep familiarity with the broader Azure platform and a demonstrated pattern of learning unfamiliar tools quickly under a delivery deadline — Salesforce, Kubernetes, and AWS among them. I'd rather name that plainly than imply expertise I don't have.

I'd welcome a conversation about the role and whether this background is the right fit for what your client needs. Thank you for your consideration.

Sincerely, Marc Berthelette
