

Dear Ravi,

I'm writing about the DevOps Architect contract opportunity (Remote, Canada). My background is a close match for the core of this role: five years of hands-on Microsoft Azure work, deep Terraform infrastructure-as-code practice, and the automation scripting (Python, Bash) and CI/CD pipeline experience the posting calls for.

At Énergir, I led cloud modernization work migrating several mission-critical services onto Microsoft Azure, building the Terraform and Ansible IaC that eliminated configuration drift across dev, staging, and production — the same shared-platform, reusable-module approach this role describes. I also standardized CI/CD delivery for 12 application teams across nine different runtimes, working with GitHub Actions and Azure DevOps pipelines daily, and drove Kubernetes-based automation at Desjardins (ArgoCD-provisioned, on-demand Artifactory environments) alongside a Python/FastAPI service that continuously validated infrastructure configuration at scale. I understand the discipline that compliance-sensitive environments demand, having delivered this work inside regulated energy and financial-services organizations.

One area I'd want to be upfront about: my Kubernetes experience is strong on the provisioning and automation side but I haven't operated AKS clusters at deep administrative depth — I'm currently working through CKA certification to close that specific gap. Everything else in the posting — Azure, Terraform, Ansible, scripting, CI/CD, Windows/Linux administration — is squarely in my day-to-day experience.

I'd welcome a conversation about the role and the client it supports. Thank you for considering my application.

Sincerely, Marc Berthelette
