

Dear Rebel Hiring Team,

I'm applying for the Systems Administrator (Lead) role. Leading a systems team through both hands-on infrastructure work and day-to-day operational priorities is a combination I have real experience with, not just on the technical side.

At SOVO Technologies, I managed a team of technicians — scheduling, training, and task delegation — while also overseeing all company IT infrastructure, including a zero-downtime server relocation and building redundancy to eliminate single points of failure. More recently, at Tink, I managed fleet configuration as code for 600+ Windows and Linux servers, automating OS-level patching and kernel-update reboots down to a monthly verification check with near-zero downtime, and drove down on-call incident frequency through root-cause analysis and prevention. At Énergir, I led cloud modernization work onto Microsoft Azure and have real, if earlier-career, hands-on AWS build experience — including EC2, S3, Route 53, and VPC — from a client migration project.

I haven't worked with Plesk or WordPress hosting specifically, though I have deep experience with Linux and Windows server administration, security patching, and access control across large server fleets, and a track record of getting productive on unfamiliar platforms quickly.

I'd welcome the opportunity to discuss how this background applies to your Systems team. Thank you for your consideration.

Sincerely, Marc Berthelette
