

Dear Tanuja,

I'm writing about the DevOps/SRE contract opportunity at TechniPros. My background lines up closely with what's described: designing highly available cloud infrastructure, automating deployment pipelines, managing Kubernetes clusters, and building the monitoring and incident-response practices that keep production systems reliable.

At Énergir, I led cloud modernization work migrating several mission-critical services onto Microsoft Azure, building Terraform and Ansible infrastructure as code that eliminated configuration drift across environments. I drove root-cause analysis on critical production incidents and built the proactive monitoring, dashboards, and automated remediation that reduced MTTR across a large application estate — the same reliability-engineering discipline this role calls for. At Desjardins, I automated provisioning of on-demand infrastructure using Kubernetes and ArgoCD, and built a Python-based service that continuously validated infrastructure configuration at scale, publishing results into Dynatrace. Earlier in my career at Tink, I also built out the compute, caching, and database layers of a client's AWS migration environment from scratch, so I'm comfortable operating across both Azure and AWS.

I noticed the posting is open to sponsorship — I'm a Canadian citizen and would want to talk through what that looks like in practice for this role, including whether the position expects on-site presence in one of the listed US cities or supports remote work. I wanted to raise that directly rather than leave it as an assumption on either side.

I'd welcome a conversation about the role and these logistics. Thank you for your consideration.

Sincerely, Marc Berthelette
