Akamai Technologies

Re: Senior II Site Reliability Engineer

Dear Akamai hiring team,

I am applying for the Senior II Site Reliability Engineer position. The opportunity to combine reliability engineering, Internet protocols, analytical problem solving, and technical leadership is closely aligned with the work I have done across complex production environments. I bring 18 years of systems and software experience, including Python automation, observability, incident analysis, networking, and cross-team platform leadership.

At Desjardins, I was initially asked to verify the configuration of approximately 250 enterprise Artifactory repositories. I designed a Python/FastAPI service that exercised them every four hours and published their health signals to Dynatrace. Rather than build a narrow JFrog-specific script, I kept the validation logic tool-agnostic and made the test set configurable. The same system then became the regression safety net for an enterprise platform upgrade. This is representative of how I approach reliability work: identify the signal that matters, automate its collection, make the result useful to operators, and build something durable enough to support the next problem as well as the immediate one.

At Énergir, I lead CI/CD and platform-reliability improvements across 12 teams and more than 70 applications. I conduct root-cause analysis for critical incidents, build monitoring and operational dashboards, and implement automated remediation so recurring failures become less likely and easier to diagnose. I have also led Azure modernization work with Terraform and Ansible and influenced platform adoption across teams outside any reporting line through technical guidance, documentation, and recurring enablement sessions.

My earlier infrastructure experience adds the networking and systems foundation relevant to Akamai's platform. I have worked with DNS, HTTP and HTTPS, TLS, TCP/IP, load balancing, routing, firewalls, proxies, NetScaler, and Cisco networking while operating Linux production environments and participating in 24/7 on-call. I also wrote production software for approximately seven years and continue to use Python, Bash, SQL, and Java in automation and platform work.

I want to be precise about one boundary in my fit. My analytical work has centered on production telemetry, health signals, incident evidence, and operational trends rather than formal statistical data science. What I offer is the ability to turn complex system behavior into measurable signals, investigate failures across application and infrastructure boundaries, and communicate clear technical recommendations to engineering and business stakeholders.

I would welcome the opportunity to bring that combination of reliability engineering, networking, automation, and technical leadership to Akamai's distributed platform. I am based near Ottawa, fully bilingual in English and French, and available to work remotely.

Sincerely,

Marc Berthelette
