BeyondTrust

Re: Cloud Engineer

Dear BeyondTrust hiring team,

I am applying for the Cloud Engineer role because its combination of infrastructure automation, cloud governance, operational reliability, and compliance closely matches the work I have delivered in regulated financial-services and energy environments.

At Énergir, I led Azure modernization for mission-critical services and standardized Terraform and Ansible practices across development, staging, and production. I partnered with Enterprise Architecture on resilient cloud designs aligned with cloud-native and zero-trust principles, standardized CI/CD for 12 teams and more than 70 applications, and translated incident findings into monitoring and automated remediation.

At Desjardins, I implemented controls for an enterprise platform in a regulated financial-services environment. I built Splunk alerts that detected configuration changes made outside approved CI/CD pipelines, automated isolated test environments with Kubernetes and ArgoCD, and developed a Python/FastAPI validation service that continuously checked approximately 250 repositories. The validation system later became the regression safety net for an enterprise platform upgrade, providing repeatable evidence that changes had not violated expected configuration.

My AWS experience comes from a six-month migration initiative at Tink. I built the target environment's compute, storage, DNS, networking, caching, and database layers using EC2, S3, Route 53, VPC, self-managed caching, and a serverless relational database. The client cancelled the migration before production cutover, and those resources were provisioned through the AWS console rather than Terraform, so I want to be precise about the extent of that experience.

I have not worked directly within a FedRAMP boundary and do not currently hold the AWS certification listed in the posting. I would nevertheless be productive immediately in Terraform, CI/CD, automated validation, change governance, compliance evidence, incident response, and technical documentation. I would approach BeyondTrust's AWS account structure and FedRAMP controls with the same disciplined method I have used in other regulated environments: understand the control objective, encode the approved path, validate continuously, and make deviations visible.

I am based in Ontario and available immediately. I would welcome the opportunity to discuss how my automation, governance, and reliability experience could support BeyondTrust's regulated AWS environment.

Sincerely,

Marc Berthelette
