Cresta

Re: Infrastructure Engineer/SRE

Dear Cresta hiring team,

I am applying for the Infrastructure Engineer/SRE role because its focus on developer tooling, infrastructure automation, Kubernetes, observability, and highly autonomous ownership closely matches the work I have delivered across enterprise platform environments.

At Desjardins, I designed and built a Python/FastAPI service that continuously tested the configuration and health of approximately 250 remote repositories and published technology-specific results to Dynatrace. I developed the validation logic as a configurable, mostly tool-agnostic system, allowing it to become the regression safety net for an enterprise platform upgrade. I also automated isolated environments with Kubernetes and ArgoCD, implemented artifact lifecycle policies, and built Splunk alerts for changes made outside approved CI/CD pipelines.

At Énergir, I standardized CI/CD delivery across nine runtimes for 12 teams and more than 70 applications. I implemented Terraform and Ansible practices across environments, supported Azure modernization, and translated recurring incident findings into improved monitoring and automated remediation. A consistent part of my work has been learning unfamiliar application ecosystems, understanding what developers need from the platform, and turning common delivery problems into reusable automation.

Earlier at Tink, I supported a 600-server Linux estate in a 24/7 environment, centralized Jenkins Pipeline as Code for more than 80 applications, built a fleet-wide software inventory and risk platform, and automated a recurring Elasticsearch recovery. I also built the compute, storage, DNS, networking, caching, and database layers of an AWS migration target using EC2, S3, Route 53, and VPC.

I want to be precise about the areas where I would need to grow. My Kubernetes experience centres on application and environment automation with Kubernetes, Helm, and ArgoCD; I have not owned large EKS clusters at the control-plane and node-pool level. My AWS experience is hands-on but less extensive than my Azure background, and I have not operated PostgreSQL or GPU-enabled Kubernetes clusters at Cresta's likely scale.

What I bring is strong Python automation, IaC, GitOps, observability, Linux operations, incident response, and an 18-year record of learning unfamiliar systems under real delivery constraints. I would welcome the opportunity to help Cresta improve the infrastructure and developer workflows that support its AI platform.

Sincerely,

Marc Berthelette
