Keyfactor

Re: Senior DevOps Engineer

Dear Keyfactor hiring team,

Keyfactor's Senior DevOps Engineer role is unusually close to the work I have been doing: Azure infrastructure, CI/CD, Kubernetes-based delivery, ArgoCD, Artifactory, Ansible, reliability, and technical leadership. I am interested in helping your engineering teams make secure software delivery faster, more repeatable, and easier to operate across cloud and on-premises environments.

At Desjardins, I was initially asked to verify the configuration of approximately 250 JFrog Artifactory repositories. I built a configurable Python/FastAPI validation service that tested them every four hours and published the results to Dynatrace. Because I designed the validation logic to extend beyond the original request, the same service became the regression safety net for the enterprise Artifactory upgrade. I also automated on-demand Artifactory environments using Kubernetes and ArgoCD and added Splunk alerts for configuration changes made outside CI/CD. My approach is to recommend what is best for the client and the platform, not simply the least expensive answer to the immediate ticket.

At Énergir, I standardized CI/CD for 12 application teams and more than 70 applications across nine runtimes. I led Microsoft Azure modernization for mission-critical services, standardized Terraform and Ansible Infrastructure as Code, and drove incident analysis, monitoring, and automated remediation in a regulated energy environment. Adoption mattered as much as implementation: I supported teams through documentation, recurring enablement sessions, and direct technical guidance without relying on reporting authority.

Earlier at Tink, I centralized Jenkins Pipeline as Code for more than 80 applications and automated patching across a 600-server Linux estate. Root-cause analysis and prevention reduced our paging frequency from roughly one page every two rotations to one every four or five. That operational background informs how I design deployment tooling: reliability, security, observability, and recovery are part of the delivery system rather than later additions.

I want to be precise about Kubernetes depth. I have used Kubernetes, ArgoCD, Docker, and Helm to automate and deploy enterprise environments, but I have not owned large production Kubernetes clusters at the node-pool and control-plane level. What I bring is deep Azure and DevOps experience, a strong record of learning unfamiliar platforms under real delivery constraints, and the judgment to be direct about where expertise ends.

I am based in Ontario, work in the Eastern time zone, and am available immediately. I would welcome the opportunity to discuss how my Azure, Artifactory, CI/CD, automation, and reliability experience could contribute to Keyfactor's engineering organization.

Sincerely,

Marc Berthelette
