Lime

Re: Staff Software Engineer, Platform Engineering

Dear Lime hiring team,

I am applying for the Staff Software Engineer, Platform Engineering position. The opportunity to build foundational platforms, improve engineering delivery, mentor others, and own production reliability matches the work where I have consistently created the most value. I bring 18 years across software, infrastructure, and DevOps, with a record of turning narrow automation requests into reusable platforms that serve broader engineering organizations.

At Desjardins, I was asked to verify the configuration of approximately 250 enterprise Artifactory repositories. I built a Python/FastAPI service that exercised them every four hours and published health signals to Dynatrace, but I deliberately kept the validation logic tool-agnostic and the test set configurable. That broader design allowed platform administrators to evolve it for their own cases and made the same system the regression safety net for an enterprise upgrade. I also automated isolated Kubernetes environments with ArgoCD and built Splunk controls for configuration changes outside approved CI/CD paths.

At Énergir, I own CI/CD standardization across 12 application teams, more than 70 applications, and nine distinct technology stacks. I entered several of those ecosystems without prior experience, reverse-engineered how they worked, and created reusable delivery patterns with validation and quality gates. For Salesforce, I went beyond replacing legacy deployment tooling and built a validation pipeline that made unsafe candidate changes structurally unable to reach production. That is how I approach platform work: recommend and build what is best for the users of the platform, not merely the narrowest or cheapest implementation.

I also bring production operations and leadership experience. I participate in incident analysis, build monitoring and automated remediation, advise stakeholders on technology adoption, and drive adoption across teams outside any reporting line through mentoring, documentation, and recurring enablement. Earlier in my career, I wrote production software for approximately seven years and later created internal tooling that gave product owners their first fleet-wide visibility into software versions, vulnerabilities, and end-of-life risk.

I want to be precise about one boundary. My recent engineering work is weighted toward platform automation, Python, infrastructure, and delivery systems rather than Ruby on Rails product development. I nevertheless bring the software foundations, systems judgment, and cross-functional ownership needed to work across application and infrastructure boundaries, along with a demonstrated ability to learn unfamiliar systems under a delivery deadline.

I would welcome the opportunity to help Lime's engineers build, test, and operate products through secure, resilient, and scalable platform capabilities.

Sincerely,

Marc Berthelette
