Megaport

Re: Senior Site Reliability Engineer

Dear Megaport hiring team,

I am applying for the Senior Site Reliability Engineer position. The role's focus on production reliability, Linux, automation, observability, incident response, and reducing toil closely matches the work I have done throughout my career. I bring 18 years of systems and software experience, including large Linux fleets, Python and Bash automation, Terraform, CI/CD, on-call operations, and cross-team reliability leadership.

At Desjardins, I was initially asked to verify the configuration of approximately 250 enterprise Artifactory repositories. I designed a Python/FastAPI service that exercised them every four hours and published their health signals to Dynatrace. I made the validation logic tool-agnostic and the test set configurable, allowing the same system to become the regression safety net for an enterprise platform upgrade. I also automated isolated test environments with Kubernetes and ArgoCD and built Splunk alerts for configuration changes outside approved delivery paths.

At Tink, I operated a fleet of more than 600 Linux servers and participated in 24/7 on-call. I automated patching and kernel reboots, centralized logging through ELK, and built a self-healing response for a recurring Elasticsearch failure so the known condition no longer required a human page. That is the kind of reliability improvement I value most: understand the failure mode, remove the repetitive work, and leave the broader team with clear signals and maintainable operating practices.

At Énergir, I now lead delivery and reliability improvements across 12 teams and more than 70 applications. I conduct root-cause analysis, build dashboards and automated remediation, and use Terraform and Ansible to make environments more consistent. I also mentor teams outside any reporting line through documentation, recurring enablement sessions, and hands-on technical guidance.

I want to be precise about my cloud fit. Azure is my strongest production cloud. I built an AWS migration target over approximately six months using EC2, S3, Route 53, VPC, caching, and a serverless database, but the client cancelled before production cutover. My Kubernetes experience is practical and growing rather than deep cluster-administration ownership. I would bring those boundaries honestly, alongside proven Linux, automation, observability, and incident-response depth.

I would welcome the opportunity to contribute to Megaport's remote-first SRE team and help strengthen the systems and practices behind its global network platform.

Sincerely,

Marc Berthelette
