Mercury

Re: Senior Software Engineer - SRE

Dear Mercury team,

Mercury's plan to embed SREs with product teams is what drew me to this role. My best work has come from identifying recurring operational weaknesses, building durable fixes, and helping teams adopt practices that keep working after I move on.

At Tink, I supported a fleet of more than 600 servers in a 24/7 on-call rotation. Root-cause analysis, prevention, and automation reduced our paging frequency from roughly one page every two rotations to one every four or five. For one unstable Elasticsearch cluster, I connected monitoring to a Bash remediation process so the known failure could recover automatically instead of waking an engineer.

At Desjardins, the initial assignment was to verify the configuration of Artifactory repositories. I built a configurable Python/FastAPI health service that tested approximately 250 repositories every four hours and published the results to Dynatrace. Because the validation logic was largely tool-agnostic, the same service later became the regression safety net for the platform's version upgrade. My approach is to recommend what is best for the client, not necessarily what is cheapest in the moment.

I have also standardized CI/CD for 12 application teams at Énergir, led incident analysis, improved monitoring and automated remediation, and built enablement practices that turned delivered tooling into sustained use. This combination of reliability engineering, production software, observability, and financial-services experience aligns closely with the outcomes Mercury describes.

I want to be direct about the gaps. I do not have the significant PostgreSQL or Temporal workflow experience listed in the posting, and I have not worked in Haskell. What I bring instead is an 18-year record of learning unfamiliar systems under real delivery constraints, fixing systemic problems, and being precise about what I know.

I am based in Ontario and available immediately. I would welcome a conversation about how I could help Mercury's product teams build stronger on-call, observability, and reliability practices.

Sincerely,

Marc Berthelette
