Midnite

Re: Senior Platform Engineer

Dear Midnite hiring team,

The opportunity to help build the platform foundations for Midnite's Canadian launch is what drew me to this role. It combines backend engineering, reliability, regional readiness, and independent ownership—the intersection where I have done my strongest work. I enjoy entering complex systems, understanding their boundaries and failure modes, and delivering improvements that help product teams move faster without sacrificing operational safety.

At Desjardins, I was initially asked to verify the configuration of approximately 250 JFrog Artifactory repositories. I designed and built a Python/FastAPI service that exercised those repositories every four hours and published technology-specific health signals to Dynatrace. I kept most of the validation logic independent of Artifactory and made the test data configurable, allowing the same system to become the regression safety net for an enterprise platform upgrade. I also automated isolated test environments with Kubernetes and ArgoCD and implemented Splunk alerts for configuration changes made outside approved delivery paths.

At Énergir, I independently learned nine application ecosystems and standardized CI/CD for 12 teams and more than 70 applications. That work required understanding application dependencies, designing reusable delivery interfaces, separating application failures from platform failures, and communicating decisions clearly across teams. I also standardized Terraform and Ansible provisioning and led incident analysis, monitoring, and automated remediation for critical services.

Earlier at SOVO Technologies, I wrote production C++ and Java software for approximately seven years, including the scheduling system used for the production department's complete planning cycle. At Tink, I combined that software mindset with infrastructure ownership: I built a software inventory platform for a 600-server estate, centralized delivery for more than 80 applications, and contributed to an AWS migration environment using EC2, S3, Route 53, VPC, caching, and relational database services.

I want to be precise about fit. My recent cloud depth is strongest in Azure, and I have not operated Kafka, SQS, or PostgreSQL at the scale described in the posting. My AWS experience is real but earlier and less extensive. What I bring is hands-on Python/FastAPI development, platform and reliability engineering, production software experience, and a consistent record of learning unfamiliar systems quickly and taking ambiguous work through to delivery.

I am based in Ontario, eligible to work in Canada, and comfortable collaborating asynchronously across time zones. I would welcome the opportunity to help Midnite strengthen its service boundaries, observability, deployment practices, and regional readiness as it launches and grows in Canada.

Sincerely,

Marc Berthelette
