N3XT
Re: DevOps Engineer (L2/L3)

Dear N3XT Hiring Team,

I'm a Senior DevOps Engineer with nearly 18 years of experience building and operating infrastructure automation for enterprise clients -- most recently a 6-month engagement with Desjardins where I automated environment provisioning with Kubernetes and ArgoCD, and built Splunk-based alerting to catch configuration changes made outside the CI/CD pipeline, directly improving incident visibility and auditability. That combination of infrastructure-as-code discipline and incident-management rigor maps closely to what this role is asking for.

At Energir, I standardized Infrastructure as Code with Terraform and Ansible across dev, staging, and production, while driving root-cause analysis on critical incidents and building proactive monitoring to reduce MTTR -- directly relevant to owning alerting pipelines and improving runbooks. I bring hands-on Python and Bash scripting from across my engagements, along with Dynatrace and Splunk observability experience that transfers directly to Datadog and Grafana.

I'm based remotely in Canada, incorporated, and available to discuss fit for this role.

Best regards,

Marc Berthelette
