OVHcloud

Re: Senior SDE/SRE - VPC & Network

Dear OVHcloud hiring team,

I am applying for the Senior SDE/SRE - VPC & Network position. The role appeals to me because it combines reliability, cloud infrastructure, automation, and ownership across a service's complete lifecycle. This is where I have consistently delivered my strongest work: understanding a complex system and its failure modes, then building the automation and operational signals needed to run it confidently.

At Desjardins, I was initially asked to verify the configuration of approximately 250 Artifactory repositories. I designed a Python/FastAPI service that exercised them every four hours and published their health signals to Dynatrace. I kept the validation logic independent of Artifactory and made the test cases configurable, allowing the same system to become the regression safety net for an enterprise platform upgrade. I also automated isolated environments with Kubernetes and ArgoCD and implemented Splunk alerts for changes made outside approved CI/CD paths.

At Énergir, I standardized delivery for 12 teams and more than 70 applications, led migrations of critical services to Azure, and introduced Terraform and Ansible practices to reduce configuration drift. I also lead root-cause analysis, build operational dashboards, and automate corrective actions so incidents are easier to understand and less likely to recur.

I want to be precise about my fit. I bring strong Linux, Python, networking, infrastructure-as-code, CI/CD, observability, and cloud-operations experience, but I would not present myself as already having hands-on Neutron or OVN/OVS expertise. What I do bring is a demonstrated ability to learn unfamiliar platforms under a delivery deadline, understand how they actually work, and turn that understanding into something dependable and operationally sustainable.

I am fluent in English and French and available for a hybrid arrangement in Montréal, subject to confirming the office cadence. I would welcome the opportunity to discuss how my reliability and automation experience could contribute to the maturity of OVHcloud's VPC platform.

Sincerely,

Marc Berthelette
