Professional Summary

Senior DevOps and platform engineering consultant with 18 years of experience automating delivery infrastructure and production operations in complex regulated environments. At Énergir, standardized CI/CD across 12 teams, more than 70 applications, and nine technology stacks while modernizing services on Microsoft Azure with Terraform and Ansible. At Desjardins, built Python automation, production telemetry, configuration controls, and repeatable Kubernetes test environments for an enterprise platform. Brings deep experience in cloud delivery, Jenkins and pipeline engineering, environment automation, observability, incident response, security-conscious operations, and technical documentation. Recently introduced AI-assisted engineering practices with strict scope gates and human validation before generated code reaches production.

Technical Skills

Cloud and Infrastructure Automation	Microsoft Azure, Terraform, Ansible, Puppet, Linux, Windows Server, AWS (EC2, S3, Route 53, VPC)
CI/CD and Delivery Infrastructure	Jenkins, Azure DevOps, GitHub Actions, Pipeline as Code, ArgoCD, Git, release automation, environment automation
Scripting and Systems	Python, FastAPI, Bash, Java, C++, SQL, NoSQL, command-line automation, production troubleshooting
Containers and Platforms	Docker, Kubernetes, Helm, JFrog Artifactory, Nexus, CloudFoundry
Observability and Operations	Dynatrace, Splunk, ELK Stack, PRTG, dashboards, alerting, incident response, root-cause analysis, automated remediation, 24/7 on-call
Security and Governance	Secrets-aware delivery, least-privilege and zero-trust collaboration, configuration drift detection, vulnerability visibility, audit controls
AI-Assisted Engineering	Scoped AI-assisted development, prompt use, output risk evaluation, human-validation checkpoints, controlled promotion

Work Experience

Énergir — Senior DevOps Engineer

Montréal, QC | September 2021 – Present

- Standardized CI/CD delivery across nine runtimes for 12 application teams and more than 70 applications, replacing manual deployments with reusable pipelines, automated validation, quality gates, and documented operating practices.
- Automated Oracle delivery after an earlier implementation attempt had failed, converting a fully manual process into a repeatable deployment workflow for a production application team.
- Rebuilt Salesforce delivery with the supported CLI, then created a validation pipeline that deployed every candidate change to a dedicated sandbox and ran the complete test suite before promotion, reducing missed deployment windows to one since launch.
- Led Microsoft Azure modernization for several mission-critical services and implemented Terraform and Ansible practices that standardized provisioning and reduced configuration drift across development, staging, and production.
- Drove root-cause analysis for critical incidents and delivered monitoring, dashboards, alerts, and automated remediation that improved operational visibility and reduced recovery time.
- Introduced AI-assisted engineering practices with hard scope gates and human-validation checkpoints before generated code can reach production; assessed risks and raised the need for equivalent organizational safeguards.

- Worked across concurrent transformation initiatives and enabled 12 teams outside any reporting line through recurring technical sessions, operational documentation, and hands-on delivery support.

Key technologies: Microsoft Azure, Azure DevOps, GitHub Actions, Terraform, Ansible, Python, Bash, Oracle, Docker, ELK Stack, ServiceNow

Desjardins — Senior DevOps Engineer (Contract)

Montréal, QC (Remote) | October 2025 – March 2026 — *concurrent engagement alongside the Énergir role*

- Delivered a six-month engagement hardening an enterprise JFrog platform, building a Python/FastAPI service that validated approximately 250 remote repositories every four hours and published health telemetry to Dynatrace.
- Expanded a configuration-check request into a tool-agnostic, configurable validation harness that became the regression safety net for the enterprise Artifactory version upgrade.
- Automated on-demand Artifactory environments with Kubernetes and ArgoCD, giving administrators repeatable, isolated environments for testing upgrades and configuration changes.
- Built Splunk alerts for manual changes outside approved CI/CD paths, improving auditability and making production configuration drift visible.
- Implemented artifact lifecycle policies that enforced retention standards and reduced unnecessary storage consumption.

Key technologies: Python, FastAPI, JFrog Artifactory, Docker, Kubernetes, ArgoCD, Helm, GitHub Actions, Dynatrace, Splunk

Tink — DevOps Engineer

Montréal, QC | January 2018 – August 2021

- Centralized Jenkins Pipeline as Code for more than 80 applications across 20 clients, standardizing build and deployment procedures across technology stacks and adding release visibility through Jira integration.
- Automated operating-system patching, maintenance, and kernel-update reboots across more than 600 servers, reducing the process to a monthly verification check with near-zero downtime.
- Managed declarative fleet configuration with Puppet and Spacewalk and built centralized ELK logging to improve production troubleshooting and incident response.
- Built the compute, storage, DNS, networking, caching, and database layers of an AWS migration target using EC2, S3, Route 53, VPC, self-managed caching, and a serverless relational database; the client cancelled the migration before cutover.
- Created fleet-wide software inventory and vulnerability visibility covering application versions, CVEs, end-of-life software, and SSL/TLS posture across more than 600 servers.
- Implemented self-healing automation for an unstable Elasticsearch cluster so monitoring restored service automatically instead of paging an engineer.

Key technologies: Jenkins, Bash, Linux, Puppet, Spacewalk, ELK Stack, PRTG, Jira, AWS, SQL, networking, security operations

SOVO Technologies — Lead Technician to Software Engineer

Montréal, QC | November 2008 – December 2017

- Owned company infrastructure, delivered a zero-downtime server relocation, and introduced redundancy that eliminated core single points of failure while managing and training technicians.
- Maintained backup and recovery capabilities and served as the final quality-assurance gate for production releases.
- Designed and wrote production software for approximately seven years, including scheduling, voice-recognition evaluation, and multilingual dictionary systems.

Key technologies: C++, Java, SQL, NoSQL, Linux, Windows Server, Active Directory, VMware vSphere, networking, backup and recovery

Education

Bachelor of Automated Manufacturing Engineering — École de Technologie Supérieure, Montréal, QC | 2005 – 2016

DCS in Computer Science Technology — Cégep André-Laurendeau, Montréal, QC | 2002 – 2005
