Professional Summary

Senior DevOps and platform engineer with 18 years across infrastructure and software engineering in regulated financial-services and energy environments. Standardized CI/CD for 12 teams and 70+ applications, built Python platform tooling for 250 enterprise artifact repositories, and automated cloud infrastructure with Terraform and Ansible. Combines developer enablement, observability, incident response, and technical evaluation with disciplined AI-assisted engineering practices that require security controls and human validation before promotion. Deep Microsoft Azure experience plus a real, bounded AWS infrastructure build spanning EC2, S3, Route 53, VPC, caching, and relational data services.

Core Expertise

Infrastructure Automation	Terraform, Ansible, Puppet, Microsoft Azure, AWS, environment provisioning, configuration management
Developer Enablement	Self-service infrastructure, CI/CD standardization, pipeline-as-code, internal tooling, technical documentation and mentoring
Reliability & Observability	Dynatrace, Splunk, ELK, incident response, RCA, postmortems, alerting, automated remediation, MTTR reduction
AI-Assisted Engineering	AI-tool evaluation, hard scope gates, human-validation checkpoints, secure promotion practices
Programming & Systems	Python, FastAPI, Bash, Java, C++, SQL, NoSQL, Linux, Docker, Kubernetes, ArgoCD

Work Experience

Énergir — Senior DevOps Engineer

Montréal, QC | September 2021 – Present

- Owned CI/CD standardization for 12 application teams and 70+ applications across nine distinct runtimes, replacing manual delivery with automated pipelines and quality gates.
- Led cloud modernization for 5–10 mission-critical services on Microsoft Azure and implemented Terraform and Ansible automation to standardize provisioning and reduce configuration drift.
- Drove critical-incident RCA and built monitoring, observability dashboards, and automated remediation to reduce MTTR.
- Introduced AI-assisted engineering practices with researched scope gates and human-validation checkpoints before generated code can reach production; identified and raised the absence of equivalent organization-wide safeguards.
- Reduced pipeline triage effort by separating application-code errors from platform errors in reporting, making failures self-diagnosing for engineering users.
- Led adoption without reporting authority through recurring enablement sessions with all 12 application teams.

Key technologies: Microsoft Azure, Terraform, Ansible, Azure DevOps, GitHub Actions, Python, Bash, Databricks, CloudFoundry, ServiceNow

Desjardins — Senior DevOps Engineer (Contract)

Montréal, QC (Remote) | October 2025 – March 2026 — *concurrent engagement, delivered alongside the Énergir role*

- Designed and built a Python/FastAPI service that validated roughly 250 enterprise JFrog repositories every four hours and published platform-health results to Dynatrace.
- Expanded a narrow configuration-verification assignment into a tool-agnostic, configurable validation platform that became the regression-safety net for the enterprise JFrog upgrade.

- Automated provisioning of on-demand Artifactory environments with Kubernetes and ArgoCD, providing administrators with self-service environments for safe testing.
- Implemented artifact-lifecycle policies and Splunk alerting for configuration changes made outside the CI/CD pipeline, improving governance and auditability.

Key technologies: Python, FastAPI, Kubernetes, ArgoCD, GitHub Actions, JFrog Artifactory, Dynatrace, Splunk, Docker, Helm

Tink — DevOps Engineer

Montréal, QC | January 2018 – August 2021

- Built the compute, caching, database, DNS, and network layers of a client's AWS migration target using EC2, S3, Route 53, VPC, self-managed memcached, and a serverless relational database; the client cancelled before production cutover, and resources were provisioned through the AWS console.
- Centralized Jenkins Pipeline as Code for 10–15 developers maintaining 80+ applications for 20+ clients, standardizing delivery across heterogeneous stacks.
- Automated OS patching and kernel-update reboots across 600+ Linux servers and managed fleet configuration declaratively through Puppet and Spacewalk.
- Conceived and built an internal software-inventory platform exposing CVE, end-of-life, and SSL/TLS risks across the fleet to product owners.
- Built ELK observability and an automated self-healing response for a recurring Elasticsearch failure; participated in 24/7 on-call operations.

Key technologies: AWS (EC2, S3, Route 53, VPC), Jenkins, Linux, Bash, Puppet, Spacewalk, ELK Stack, PRTG, Jira

SOVO Technologies — Lead Technician → Software Engineer

Montréal, QC | November 2008 – December 2017

- Owned company infrastructure, including a zero-downtime server relocation and redundant architecture eliminating single points of failure, while managing and training a technician team.
- Wrote production software for roughly seven years, including a production scheduling platform and voice-recognition evaluation tooling.

Key technologies: C++, Java, SQL, Windows Server, Linux, Active Directory, VMware vSphere, Cisco routing, firewall/VPN

Education

Bachelor of Automated Manufacturing Engineering — École de Technologie Supérieure (ÉTS), Montréal, QC | 2005 – 2016

DCS in Computer Science Technology — Cégep André-Laurendeau, Montréal, QC | 2002 – 2005
